

Active+ Software

ServiceMill

ServiceMill is the fastest and most effective way to securely run any application as a Windows NT service.

Run it as a Service

ServiceMill® instantly turns any Microsoft® Windows, MS-DOS or OS/2 executable, as well as batch files into a native Windows NT service. Running applications as native services, you gain on stability, control, security and access.

About Active+ Software

We supply organizations with tools and utilities to increase the productivity, reliability and ease of administration of mission-critical applications running on the Microsoft® Windows platforms.

"The Active+ ServiceMill OEM version did the job we needed. Thank you, for all your help on this Rolls-Royce Allison TimeClock project" - Dale Fulk

winfiles.com

ServiceMill is supplied with a single user license of Service+, a powerful Windows service administration utility that lets you Start, Stop, Restart, Edit Properties, Sort, Remove, Kill services simultaneously.

ServiceMill is a native unicode application supporting English, French, German, Italian, Japanese and Russian.

For Microsoft® Windows 2000, XP, NT4.0 (service pack 2 or later recommended).

Benefits:

- Run applications securely as services without the need of a user session.
- No modifications are required for existing programs to work as a service.
- Run most executables: 16 bit (Windows, DOS, OS/2), 32 bit and batch files as a native NT service.
- Run custom applications written in: Visual Basic, PowerBuilder, Delphi, Java, etc.
- Run programs that require interactive mode and network access at the same time.
- Run under a specific user account any application scheduled by the NT Task Scheduler (AT command).

Features:

- Restores network drives when the process starts.
- Starts application at predefined interval.
- User interface Integrates with MMC.
- Remote & Local administration supported.
- Reports private errors to the event log.
- Lets you set process specific environment variables
- Lets you specify window position at startup
- Automatically restarts applications that terminate when a user logs off
- Lets you specify the application priority (High, Normal, Idle)
- Multi-processor support (Specify processors on which to run the application)

ServiceMill Control

ServiceMill Control is an ActiveX Control (OCX) version of ServiceMill, easy to include inside your code. It lets you quickly turn your custom applications into a native Windows NT service. For developers.

- ▶ Convert your existing VB and Delphi applications into a service very easily.
- ▶ Run your application securely without the need of a user session.
- ▶ Native Windows NT service support. All Service Manager calls are converted to service Events: Start, Stop, Pause, Shutdown, Control(PrivateCode), etc.

- ▶ Thread safe. All calls into your code are made through the process primary thread.
- ▶ Support for Windows 95 and Windows 98. Simulates Windows NT service manager calls when your program runs under these environments.
- ▶ Implements all necessary methods to Install, Uninstall and Control your services.
- ▶ Grants required Windows NT privileges to any user account configured to start the service.
- ▶ Event log support. Your application can report errors and information to the Windows NT event log.
- ▶ Very easy to test and debug. Simulates the NT service manager at design time.
